Summer Internship Opportunities at IBM T.J. Watson Research Center

The Program Analysis and Verification group at the NY IBM T.J. Watson Research Center has openings for summer internships in the following areas:

- Software Analysis/Verification/Synthesis
- Concurrent Programming (Multi-core systems, GPUs, etc.)

Our summer internship program provides students with a unique opportunity to experience the research environment that exists here at IBM. The program is highly competitive, and is designed for top students who are interested in tackling challenging research problems. Many of our student interns have authored papers, or even theses, out of their sojourn with us, and many have contributed significantly to open source projects.

IBM Research fosters close partnerships with the other IBM divisions that work in these areas and consequently we are constantly exposed to real world problems. This puts IBM Research in a unique position where we become aware of fundamental research challenges and opportunities in the real world before they are visible to the research community at large.

Top students who are interested in the above topics, and who want to pursue a summer internship with the group at the NY T. J. Watson Research Center, should apply by sending a resume to Eran Yahav (eyahav@us.ibm.com).

Starting at 2010, Eran Yahav will be a faculty member in the Department of Computer Science at the Technion. This internship can therefore lead to a longer term collaboration and full thesis supervision.

Check out our list of projects and experience of interns in previous years at: http://www.research.ibm.com/people/e/eyahav/
