

# A Tele-care Robot Communication system

**A communication system for an autonomous tele-care robot aimed to assist elderly patients with daily life activities.**

Since the elderly population is growing while the number of care providers is declining, the aging problem is becoming an increasingly important social issue

The operator communicates with the Tele-care robot via a user-friendly web interface allowing him to:

- Watch and hear the other side
- Move over the room
- Help the patient with daily life activities

The patient can see and speak with the operator at any time via a simple android application without any need for knowledge
